Supplementary figure legends

Supplementary Fig 1. Changes in Ki-67 expression induced by atorvastatin treatment in (A) pre-and (B) post-menopausal patients. Analysis of modulation in Ki-67 expression by menopause status was performed. No significant difference in the expression of biomarkers in pre- and post-atorvastatin treatment samples was observed. However, in post-menopausal women an overall decrease in Ki-67 was recorded in all groups, including the control arm. In the premenopausal group there were baseline variations amongst patients, especially in the 40 mg treatment arm.
