

**Table 1. Measurement properties required for descriptive and evaluative PROMs.**

	Assessment criteria	Description	Example(s) of criteria concerned
Measurement Properties	<b>Conceptual basis and measurement structure</b>	What the PROM specifically aims to measure and its intended population.	Appropriate scale and subscale structure. Suitable scoring with an appropriate level of measurement (nominal, ordinal, interval or ratio).
	<b>Reliability</b>	The degree to which a PROM is free of random error and reflects the true score. In terms of psychometric theory C/o <b>Internal consistency</b> (the level of homogeneity of the items in the scale and thus whether they are all measuring the construct of interest) and <b>Test-retest reliability</b> (its temporal stability).	<b>Internal consistency</b> - Cronbach's $\alpha$ or split half reliability . <b>Test-retest reliability</b> - intraclass correlation co-efficients or Pearson's Product Moment Correlation Co-efficients to assess the level of agreement between 2 administrations.
	<b>Validity</b>	How well the PROM measures what it is intended to measure. C/o <b>Face validity</b> concerns whether it appears to be measuring the construct(s) of interest; <b>content validity</b> the extent to which the items satisfy the entirety of the concept(s) being measured; <b>internal construct validity</b> whether there is evidence available to support its theoretical basis; <b>external construct validity</b> - interpretation of the scores from what is being measured; and <b>criterion validity</b> regards how well the findings from the new scale correlate with any existing gold standards.	<b>Content validity</b> - assessed through expert and patient opinion regarding relevance of and breadth of coverage of the items of the PROM. <b>Construct validity</b> - ascertained through hypothesis testing and the development of correlates for predictive, convergent and divergent validity. <b>Criterion validity</b> - obtained through the level(s) of correlation with existing gold standard(s).
	<b>Responsiveness</b>	Ability of the PROM to detect change over time that is of clinical relevance to the intended population(s).	No general consensus exists regarding responsiveness assessment, but can include distribution based methods (effect size, standardised response mean) or anchor based methods.
	<b>Precision</b>	Capability of the PROM to discriminate effectively between patients in terms of their reported condition and therefore the range of responses permitted.	Item coverage of the defined constructs of the PROM, the number of response categories (thus level of measurement) and the presence of any end effects (floor and ceiling) are important considerations.
	<b>Interpretability</b>	What the quantitative changes in instrument scores actually mean to both patients and clinicians.	Anchor and distribution based methods are available, such as score distribution and health transition items, respectively.
Practical properties	<b>Clinician feasibility and Patient acceptability</b>	The time and effort required by both patients and clinicians - includes both acceptability (pertains to how prepared patients and clinicians are to use the PROM) and feasibility (how easy the PROM is to complete. costs and time demands).	Acceptability and feasibility can be assessed using techniques such as collation of patient and clinician opinions, response rates, missing values and extent of instrument completion.

**Table 2. Description of development and content of Classical Test-Theory-based, generic, foot-specific PROMS.**

	PROM	Authors	Content generation methods	Items	Type of response scale	Constructs assessed
Classical test theory-based, generic, foot specific PROMS	The Foot Function Index [22]	Budiman-Mak <i>et al</i> , (1991)	Not stated	23	10 cm VAS	Foot Pain Foot-related Disability Foot-related Activity Limitation
	The Manchester Foot Pain and Disability Questionnaire [28]	Garrow <i>et al</i> , (2000)	Open-ended interviews with 32 patients attending foot clinics with foot-related pain, disability, activity limitation and footwear problems	19	3 point adjectival rating scale	Functional limitation Pain intensity Personal appearance
	The Podiatry Health Questionnaire [30]	Macran <i>et al</i> , (2003)	Unspecified number of podiatry managers and podiatrists	7	6 point adjectival rating scale 20 cm VAS	Walking/getting about Hygiene Nail care Foot pain Worry/concern Quality of life
	The Bristol Foot Score [32]	Barnett <i>et al</i> , (2005)	Semi-structured interviews with 10 patients with unspecified foot problems (7 females, 3 males)	15	3 to 6 point adjectival rating scales	Concern and pain Footwear and general foot health Mobility
	The Foot Health Status Questionnaire [34]	Bennett <i>et al</i> (1998)	Unspecified number of podiatric surgeons	13	5 point adjectival rating scale	Foot pain Foot function Footwear General Foot Health
	The AAOS Lower Limb Outcomes Assessment Instrument: Global Foot and Ankle Scale [36]	Johanson <i>et al</i> , (2004)	Unspecified number of focus groups with content-knowledgeable experts Literature review of potentially relevant outcome measures	20	5 to 7 point adjectival rating scale Guttman scale	Pain Function Stiffness Swelling Giving way
	The AAOS Lower Limb Outcomes Assessment Instrument: Shoe Comfort Scale [36]	Johanson <i>et al</i> , (2004)	Focus groups with content-knowledgeable experts Literature review of potentially relevant outcome measures	5	3 point adjectival rating scale	Ability to wear different kinds of footwear
	The Rowan Foot Pain Assessment Questionnaire [40]	Rowan, (2000)	6 focus groups and 2 semi-structured interviews with patients with chronic foot pain (17 females, 5 males)	39	5 point adjectival rating scale	Sensory pain Affective pain Cognitive dimensions of pain Questionnaire Comprehension

**Table 3. Evidence for the scientific measurement properties of the CTT – based, generic, foot specific PROMs.**

Type of PROM	Instrument and Author(s)	Measurement Properties of CTT-based generic PSRQ									Practical properties		
		Reliability		Validity			Other key properties				Patient acceptability	Clinician feasibility	
		Internal consistency	Temporal stability	Content validity	Face validity	Criterion validity	Construct validity		Responsiveness	Sensitivity			Clinical interpretability
						Internal	External

**Table 4. Description of development and content of Classical Test Theory and Item Response Theory-based, JIA disease-specific, RA disease-specific and generic foot-specific PROMS.**

	PROM	Authors	Content generation methods	Total number of items	Type of response scale	Constructs assessed
Classical test theory-based, JIA disease and foot specific PROMs	The Juvenile Arthritis Foot Disability Index [43]	Andre <i>et al</i> , (2004)	Interviews with 2 content-knowledgeable physiotherapists Review of items in 2 potentially relevant foot-specific outcome measures: the Foot Function Index and Sundbom Arthritis Foot Evaluation Index.	23	10 cm VAS	Foot Pain Foot-related Disability Foot-related Activity Limitation
Item response theory-based, generic and foot specific PROMs	The Revised Foot Function Index – Long Form [47]	Budiman-Mak <i>et al</i> , 2006	Review of the original items of the FFI Literature review of mobility in elderly people	68	6 point adjectival rating scale	Foot pain Stiffness Difficulty related to foot function Activity limitation Social functioning
	The Revised Foot Function Index – Short Form [47]		Interviews with an unspecified number of content knowledgeable clinicians	34		Foot function summary
	The Foot and Ankle Ability Measure [50]	Martin, 2003	Literature review of signs, symptoms and limitations in physical function associated with musculoskeletal disorders of the foot, ankle and lower limb.	29	5 point adjectival rating scale	Activities of daily living Sports
Item response theory-based, foot and disease-specific PROMs	The Leeds Foot Impact Scale [52]	Helliwell <i>et al</i> , (2005)	Semi-structured interviews with 30 patients with RA-related foot problems	51	Binary categorical scale	Impairments/shoes Activities/participation

**Table 5. Evidence for the measurement properties of the Classical Test Theory and Item Response Theory-based, generic and JIA disease-specific and RA disease-specific, foot - specific PROMs.**

Type of PROM	Instrument and Author(s)	Measurement Properties of CTT-based generic PSRQ									Practical properties		
		Reliability			Validity			Other key properties			Patient acceptability	Clinician feasibility	
		Internal consistency	Temporal stability	Content validity	Face validity	Criterion validity	Construct validity		Responsiveness	Sensitivity			Clinical interpretability
						Internal	External
